What will happen to the celery after a few days in water and food colouring?

My Question: What will happen to the celery when after a few days in water and food colouring?

My Prediction: I think that the colour of the stem will change as well as the leaves.

The Equipment:
- Celery Sticks (5)
- Coloured Cups (5)
- Water
- Food colouring (red, green, blue)
- Knife

The Results:
- Day 1: The celery in red has got some red on the stem and leaves.
- Day 2: Not much change, just a little bit more colour to all of them. Red still has the most colour.

Method:
1. Cut off the ends of celery sticks, so it.
2. Put the water in all the cups, then add the 4 colours in with the water but have the tiny cup with just water.
3. Put the celery sticks in the cups wait for a couple of days then they should be done.

My Prediction:
I think it will take about 4 days to a week for it to change to the full colour.

Can you guess?
Will pumpkin and carrot grow shoots when placed in water?
